

Website Speed Optimization — Results

Live Google PageSpeed scores, measured before and after the optimization work went live.

Performance score — before → after

Full scorecard — every category, before → after

Category	Desktop		Mobile	
Performance	67 → 99	+32	51 → 92	+41
Accessibility	97 → 98	+1	97 → 96	−1
Best Practices	96 → 100	+4	96 → 100	+4
SEO	92 → 92	—	92 → 92	—
Agentic Browsing	2 / 2	Pass	2 / 2	Pass

0–49 Poor

50–89 Needs work

90–100 Good

Every category now scores in Google’s green range.

Headline wins

What changed. These are Google’s live PageSpeed Insights scores on the real website. After the optimization work was deployed, mobile performance moved from **51 to 92** and desktop from **67 to 99** — both now in the green range — while Best Practices reached a perfect 100. Accessibility (96–98) and SEO (92) remain strong. Mobile always scores a little below desktop because Google tests it on a simulated slow phone and network.

What drove the improvement

The core loading metrics Google measures, before and after — these gains are what pushed the scores up.

Core Web Vitals & loading metrics (lab test)

Metric	What it measures	Before	After	Change
Largest Contentful Paint	Time for the main content to appear	4.9s	3.9s	-1.0s
First Contentful Paint	Time until the first text/image shows	3.7s	3.2s	-0.5s
Total Blocking Time	How long the page is frozen / unresponsive	445ms	252ms	-43%
Time to Interactive	Time until the page is fully usable	7.6s	5.5s	-2.1s
Speed Index	How quickly the page looks complete	3.8s	3.2s	-0.6s
Cumulative Layout Shift	How much content jumps while loading	0.05	0.00	Eliminated

Reading this table. These figures come from a Google Lighthouse lab test (simulated mobile) run on the same device before and after the work, so they isolate the effect of the optimizations. In that same lab test the overall performance score rose from **62 to 76**; on the live site, with server caching and compression active, Google now scores it **92 on mobile and 99 on desktop**.

Why this matters for the business

Faster pages keep more visitors from leaving before the site loads, rank better in Google search, and turn more visits into phone calls and booked jobs — especially on mobile, where most emergency-plumbing searches happen. A jump from 51 to 92 on mobile moves the site from “needs work” into the range Google rewards.

What we changed

Five areas of work, all focused on making the site load and respond faster.

Optimizations delivered

1

Compressed & resized every image

Rebuilt all photos and graphics to modern WebP format at the size they actually display. Removed roughly **4 MB** of image weight — the team photo alone dropped from 929 KB to 99 KB and the hero images from ~2.7 MB to ~400 KB. Deleted large unused files left in the project.

2

Deferred heavy animation & effects code

The headline animation library and moving particle backgrounds (~100 KB of code) now load **after** the page is visible instead of blocking it. Floating widgets (chat, coupons, accessibility, mobile menu) load once the page is idle. This cut the page's "frozen" time by 43% and made the main content appear a full second sooner.

3

Added long-term browser caching

Returning visitors and repeat page views now reuse already-downloaded files — images and code cached up to a year, media for 30 days. This resolved Google's "efficient cache lifetimes" warning and helped lift Best Practices to a perfect **100**.

4

Eliminated layout shift & fixed overlap

Reserved space for late-loading elements so content no longer jumps while the page loads (layout shift now **0.00**). Also fixed the accessibility button overlapping the hero text on certain screen widths.

5

Repaired the contact-form delivery path

Found and fixed a server issue that could stop lead-form and reCAPTCHA submissions from reaching the server correctly, ensuring quote requests are delivered reliably.

Where things stand & next steps

Live and verified. The optimized build is deployed and Google has re-tested the site — the scores in this report are the current live numbers (Mobile 92 / Desktop 99).

1. Monitor. Re-run PageSpeed Insights monthly to confirm scores hold as new content is added.

2. Keep new images light. Save future photos as right-sized WebP to protect the gains.

3. Optional next round. A few more mobile points are available by trimming remaining background effects and third-party scripts.
